

Sea Creature

If I was going to be a sea creature that helps save the ocean, I would be a Shortfin Mako. I would be a Shortfin Mako because they are the fastest shark ever recorded. A Shortfin Mako has strong, sharp teeth and is quick. These traits help the Shortfin Mako protect the Earth's oceans.

If I could have one special power as a Shortfin Mako, it would be strength. If I were a Shortfin Mako with strength, then I could help the ocean a lot. When divers come down to drill into the coral reef, I would bite the drill with my strong teeth and break it. If divers went to a ship or boat that crashed and was underwater, I would use my strength to scare them away because that ship or boat could be a habitat for sea creatures. When people come to fish, I would bite the nets with my strong teeth and rip them open. The captured sea animals could then escape. When people fish with cages, I would bite the wire so no crabs or lobsters would get caught.

As a Shortfin Mako with strength, I would also carry waste that people dropped into the ocean onto an island. If an animal was trapped in a plastic bag or a can, I would rip the bag or can open with my strong, sharp teeth. I would also use my strength to pull nuclear submarines to the top so they do not leak radioactive waste into the ocean. I would also force ships that were dumping waste and oil into the ocean onto the shore.

There are a lot of ways a Shortfin Mako could save the ocean. Its strength would overpower the strength of the humans who were polluting the oceans and killing the sea animals. Hopefully the Shortfin Mako would set the example for humans about how the Earth's oceans should be protected.

Saving the World's Oceans

It is important to save the world's oceans because water makes up seventy-eight percent of the Earth. If we do not save the Earth's oceans, we will lose most of the water. If there is a lack of water, all the trees, plants, animals, and humans will die. To save the world's oceans, humans need to stop overfishing, stop dumping their waste into the ocean, and stop polluting and dropping plastic, cans, and bags into the ocean. If humans do these things, they can save the oceans, lakes, ponds, rivers, and tributaries.

When humans pollute the ponds and rivers that geese and other animals live in, they are harming the animals' habitats. The animals will die if their homes are destroyed. The animals will be unable to find new homes because the human pollution that infects one river or pond eventually flows into other rivers and ponds.

Another reason to stop polluting the ocean is that people get food from the ocean. If people pollute the ocean, there may not be any fish, lobster, crabs, shrimp, and oysters left in the ocean. There would not be any seafood because a fish that has waste in it would become sick and die.

Another reason to protect the oceans is that some people vacation at the beach. If people pollute the beach and tourists swim in the ocean, it would be gross and the tourists may get sick. Plus, some sea creatures that live in the ocean close to the beach

might die. No one would enjoy a vacation with dead animals on the shore.

Humans need to stop polluting the oceans, lakes, ponds, rivers, and tributaries and save the Earth's waters! Humans need to stop being selfish and lazy. They need to protect the Earth's oceans for future generations.
