

Caylie Crab

If I were an Ocean Protector, I would be a common crab. My name would be Caylie. You may have noticed that I spelled Caylie different than most Caylies, but I wanted my character to be a different one so her name seemed to fit. My one super power would be incredible speed.

I feel I need to elaborate on her personality. Caylie is a peculiar little crab with a lot of personality. She is passionate about life because some humans on a boat took her mom away when she was really young. Caylie is a quirky, weird, almost eerie girl who doesn't have everything figured out. She is stubborn and tough, but she has a great heart. Caylie is daring and unpredictable. The last thing I want to tell you about Caylie's personality is that it is a great deal like her body. She is like that as in she is rough on the outside but soft on the inside.

Caylie's super power is incredible speed. When you think incredible speed, you will probably think that she can run fast or move from place to place quickly. But I know that the team already has "we-zoom", so I managed to turn incredible speed to a somewhat different kind of speed. Caylie is an exceptionally fast worker. She can complete a task faster than you have ever seen. An example would be to promptly put a challenging puzzle together or clean her bedroom. Also, Caylie's claw is exceedingly strong.

Save

Everyone loves the beach. The beach is almost an enchanted place to a little kid. Making sand castles, getting hit by waves, and finding seashells are the basics for a fun day at the beach for a kid. We all remember that unbelievable joy we got, and probably still get, from the beach. Well, if we keep treating the oceans like we are, then we won't be able to go to the beach and have that joy.

There are much more serious reasons to save the oceans than that though. For example, the ocean is a vital source of protein, energy, minerals, and other products. Habitats are being destroyed, leading to marine animal extinction. Basically, without the oceans, there would not be any life on Earth. That is because we use and need so much from the ocean we couldn't survive without it. When I say "we", I mean all life on Earth.

Did you know that eighty percent of all life on Earth is made up of the animals living in the oceans? If we end up doing so much to the oceans that we don't have them anymore, eighty percent of life on Earth will be gone. Every single one of the marine animals is important to the Earth, just like we humans are. We need to accept that fact and stop polluting the oceans.
